APPLICATION DEVELOPMENT (SECP3106)

SECTION 01

LAB 1

LECTURER:

DR AHMAD NAJMI BIN AMERHAIDER NUAR

NAME	MATRIC NO
LIM YU HAN	A23CS0241

Objective

The objective of this lab assignment was to develop a basic mobile application using Flutter that allows users to record and manage their daily activities. The app demonstrates fundamental concepts learned in Lesson 1, Lesson 2, and Lesson 3 in Flutter development, including state management, user interface design, and data handling for a simple list-based application.

Brief description of the system

The Daily Activities Recorder is a mobile application built using the Flutter framework and Dart programming language. The system provides a simple interface for users to log their daily activities by entering an activity name and its associated time or category. Users can add activities to a persistent list displayed on the screen and remove them as needed. The app includes basic validation to ensure both fields are filled before adding an activity and provides user feedback through snackbar messages for successful additions and deletions.

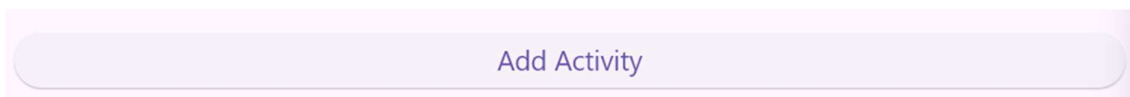

Explanation of the interface

A screenshot of a text input field with a light purple border and background. On the left side of the field is a small circular icon containing a checkmark. To the right of the icon is the placeholder text "Activity Name..." in a light purple font.

Activity name field - This text field allows users to enter the name of the activity they want to record.

A screenshot of a text input field with a light purple border and background. On the left side of the field is a small circular icon containing a clock face. To the right of the icon is the placeholder text "Time / Category..." in a light purple font.

Time / Activity button - This text field is used to specify the time or category associated with the activity.

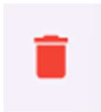

A screenshot of a button with a light purple background and a darker purple border. The button has rounded corners and contains the text "Add Activity" in a medium purple font, centered horizontally.

Add activity button - This button triggers the addition of a new activity to the list. When pressed, it checks if both input fields are filled and it use `setState()`.

ACTIVITIES (3)

Activities list - This section displays all recorded activities in a scrollable list format. Each activity is shown in a card with the activity name in bold text and the time/category below it. This section use `ListView.builder`.

Delete button - Each activity card includes a red delete icon button on the right side. Tapping this button removes the specific activity from the list and displays a confirmation snackbar.

Conclusion

This lab assignment helped me practice the development of a functional Flutter app for recording daily activities, highlighting key skills in UI design, state management, and user interaction. Overall, the project reinforced the importance of clean code structure, user feedback mechanisms, and iterative testing in mobile app development.
